                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and ABR62933) of the invention, which are therefore expected to be involved in cancer and cell growth regulation. PIM-3 is also involved the development of insulin resistance and type 2 diabetes mellitus. The invention relates to the use of PIM-3 nucleic acids and proteins in: screening assays for compounds that modulate insulin resistance or type diabetes mellitus; detection assays for detecting insulin resistance or type 2 diabetes mellitus (e.g. chromosomal mapping, tissue typing, forensic biology); predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, pharmacogenomics); and for the preparing a medicament for the treatment of insulin resistance or type
New transgenic mouse, useful as model system for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a nucleic acid construct comprising a promoter having a fully defined nucleotide sequence comprising 310 bp (ADN97341), where the promoter is operably linked to c-myc having a fully defined nucleotide sequence comprising 1320 bp (ADN97342) where the c-myc protein encoded is expressed in prostate cells of the transgenic mouse at detectable levels. The transgenic mouse can be used as an in vivo model system for the study of prostate cancer and its progression. It can also be used in preclinical and clinical models to test novel diagnostic and therapeutic modalities including drug therapies relevant to prostate cancer prevention and progression. The transgenic animal can also be used to identify molecular markers that can be mediators of progression. Indentification of the mediators is useful since they are potential

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method of designing a ligand binding to a target molecule. The method involves identifying as molecular scaffolds compounds binding to members of a molecular family, detecting orientation of scaffolds at a binding site of target, and synthesising ligand. The invention is useful for designing drug products and for designing ligand binding to target molecules such as nuclear hormone receptors, TNF receptors, G-protein coupled receptors, methyl transferases, ligases, etc. The present sequence is the Mus musculus PIN protein. This sequence is used to illustrate the method of invention.

The therapeutic agent of the invention is useful for the treatment of arteriosclerosis. The present amino acid sequence represents a mouse Pir 1 protein of the invention.

The method comprises incubating a test compound with a cell and/or cell preparation that has synthesized a specific protein of the PIM (proviral integration site) kinase family and measuring either binding of the test compound to the PIM kinase, or a functional parameter that is altered by the binding. The method of the invention demonstrates uropathic and gene therapy incontinence and the urge to urinate. The method is based upon regulating the activity or expression of PIM kinases that are involved in bladder control. The current sequence is that of the house mouse PIM-1 serine-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying substances that regulate PIM kinases, useful for treatment and diagnosis of urinary incontinence and the urge to urinate, and similar use of PIM proteins or nucleic acids.

The method involves contacting a cell expressing the polypeptide or nucleic acid with an agent to modulate the level or activity of polypeptide, or level of nucleic acid molecule. The method is useful for modulating the level or activity of HKID-1 polypeptide or polynucleotide in a subject having or predisposed to having a disorder involving cancer. Modulating HKID-1 expression or activity is useful for therapeutic purposes, for treating cellular proliferative and/or differentiative disorders including cancer or necessarily cancer of the service of the servi

PIM1 and PIM1 proteins and coding sequences are useful for treating chronic pain, particularly of neuropathic or inflammatory origin (e.g. where associated with diabetes, cancer, AIDS or neurodegenerative diseases). The present sequence is rat PIM1 kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method for identifying analgesics, useful particularly for treating chronic pain, by screening compounds for interaction with PIM-1 or kinase, or related compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the protein sequence of the rat serine/threonine protein kinase and proto-oncogene, PIM-1 PIM-1 proteins are the paralogues of novel human and murine PIM-3 proteins (see ABR62932 and ABR62933) of the invention, which are therefore expected to be involved in cancer and cell growth regulation. PIM-3 is also involved in the development of insulin resistance and type 2 diabetes mellitus. The invention relates to the use of PIM-3 nucleic acids and proteins in: screening assays for compounds that modulate insulin resistance or type 2 diabetes mellitus (e.g. chromosomal mapping, tissue typing, forensic biology) predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, pharmacogenomics); and for the preparing a medicament for the treatment of insulin resistance or type 2 diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rattus norvegicus.

                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     regulate urinary incontinence and the urge to urinate. The method comprises incubating a test compound with a cell and/or cell preparation that has synthesized a specific protein of the PIM (proviral integration site) kinase family and measuring either binding of the test compound to the PIM kinase, or a functional parameter that is altered by the binding. The method of the invention demonstrates uropathic and gene therapy applications and may be useful for treatment and diagnosis of urinary incontinence and the urge to urinate. The method is based upon regulating the activity or expression of PIM kinases that are involved in bladder control. The current sequence is that of the Norway rat PIM-1 serine-threonine kinase protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying substances that regulate PIM kinases, useful for treatment and diagnosis of urinary incontinence and the urge to urinate, and similar use of PIM proteins or nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2005-556609/57.

                                                                                                                                                                           related to tyrosine threonine kinase (TTK, see ABPS4938). TTK polynucleotides and polypeptides of the invention encompass polynucleotides and polypeptides having sequence similarity or sequence identity to human TTK and other genes and gene products related to TTK, such as Piml. The invention is based on the finding that TTK is differentially bressed in various forms of cancer. It provides methods for the identification of cancerous cells, especially breast cancer and colon cancer cells, by detection of expression levels of TTK, as well as diagnostic, prognostic and therapputic methods. These methods can be used as the basis of rational therapy. Assays for identifying molecules that modulate the activity of these genes in cancers, as well as methods of inhibiting tumour growth by inhibiting the activity of TTK are also
                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                 The invention describes a method of modulating the level or activity of human HKID-1 polypeptide, a member of serine/threonine kinase superfamily. The method involves contacting a cell expressing the polypeptide or nucleic acid with an agent to modulate the level or activity of polypeptide, or level of nucleic acid molecule. The method is useful for modulating the level or activity of HKID-1 polypeptide or polynucleotide in a subject having or predisposed to having a disorder involving cancer. Modulating HKID-1 expression or activity is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HKID-1; serine/threonine kinase; cellular proliferative disorder; differentiative disorder; cancer; haematopoietic neoplastic disorder; Acute promyeloid leukaemia; APML; Chronic myelogenous leukaemia; CML; Waldenstrom's macroglobulinaemia; WM; human.
                                                                                                                                                                                                                               Modulating levels or activity of HKID-1 polypeptides, a member of serine/threonine kinase superfamily, for treating cancer, by contacting cell expressing the polypeptide with a modulator of the polypeptide.
                                                                                                                                                                                             Example 3;

PIM1 and PIM3 proteins and coding sequences are useful for treating chronic pain, particularly of neuropathic or inflammatory origin (e.g. where associated with diabetes, cancer, AIDS neurodegenerative diseases). The present sequence is human PIM1 kinase

"Characterization of the testes-specific pim-1 tra

Nucleic Acids Res. 20:3183-3189(1992).

-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a

-!- SUBUNIT: Binds to RP9 (By similarity).

-!- SUBCILILLAR LOCATION: Cytoplasmic and nuclear

-!- PTW: Autophosphorylated (By similarity).

-!- SIMILARITY: Belongs to the Ser/Thr protein kin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NUCLEOTIDE SEQUENCE.

CATALYTIC ACTIVITY: ATP + a protein = ADP + a SUBUNIT: Binds to RP9 (By similarity).

SUBCELULAR LOCATION: Cytoplasmic and nuclear. TISSUE SPECIFICITY: Expressed primarily in cell hematopoietic and germ line lineages.

PTM: Autophosphorylated on tyrosine residues.

SIMILARITY: Belongs to the Ser/Thr protein kin

CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
SIMILARITY: Belongs to the Ser/Thr protein kinase family.

CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

TISSUE SPECIFICITY: Widely expressed. No expression in colon,
thymus, and small intestine. Expressed in human hepatoma cell
lines but not in normal liver tissues.

SIMILARITY: Belongs to the Ser/Thr protein kinase family. PIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mouse cDNA sequences.";

                                                                                                                                                                                                                                                                                                                                                                                                      TISSUE-Embryo;

Riein S., Gerhard D.S.;

Riein S., Gerhard D.S.;

Submitted (AUG-2004) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- SIMILARITY: Belongs to the Sey/Thr protein kinase family.

EMBL, BC081340; AAH81340.1; -; mRNA.
